

1-Explain the pod integration cycle.

- i) first we will install cocoapod through terminal.
- ii) Then we will open terminal and goto project folder path
- iii) then we will run command "pod init".
- iv) then we'll open podfile from our project folder and below #use framework we will write the name of pod ex- "pod "Alamofire" "
- v) then we will save the podfile and reopen project folder and this time , we will work in projectname.xcworkspace

2-How to update only a single pod.

- i) change the name of pod in podfile then run pod update.
- ii) if we run pod install then our pod will also update.

3-Delete a pod from project.

- i) remove name of pod from podfile and save it.
- ii) run pod update command.

4-update to a particular lib version.

we can update to particular version like
pod "Alamofire" ~>"5.0"

this ~> sign used to tell that we can use pod version till this version in "".
